

In the Claims

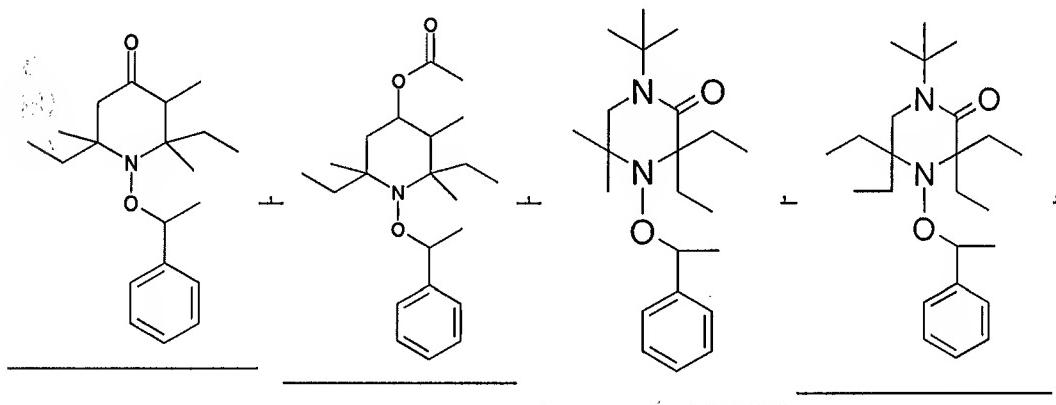

1. (currently amended) A coating composition comprising

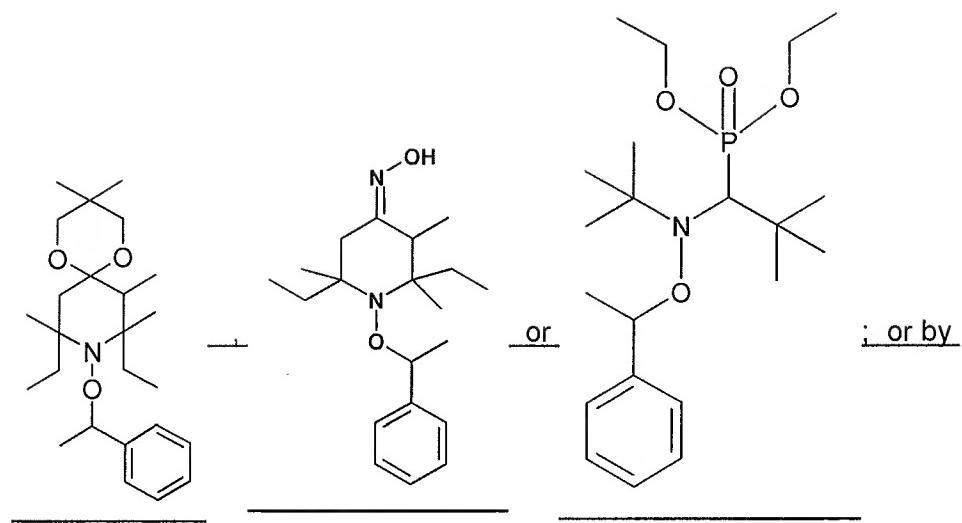

- a1) physically drying film forming binder resin or resins;
 - a2) thermally cross linking film forming binder resin or resins;
 - a3) radiation curable film forming binder resin or resins;
 - a4) autoxidatively drying film forming binder resin or resins; or
 - a5) a combination of binder resins with at least two different crosslinking mechanisms selected from a1), a2), a3) and a4);
- b) a polymer or copolymer levelling agent of formula (I)

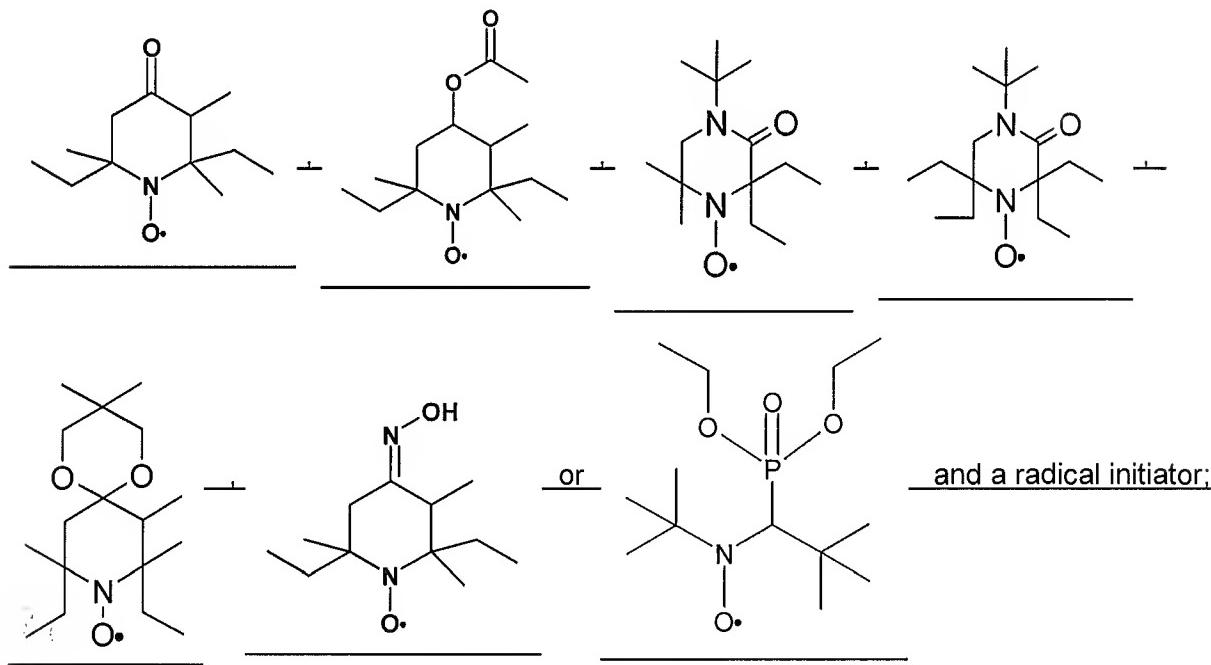

obtained by ~~nitroxyl-mediated controlled free radical polymerization~~ wherein

b1) polymerization in the presence of an alkoxyamine initiator/regulator of formula

b2) polymerization in the presence of a stable nitroxyl free radical of formula

wherein

In is the initiator fragment starting the polymerization reaction;

M is at least one monomer selected from the group consisting of acrylic acid, methacrylic acid, acrylic acid (C_1-C_{22})alkyl esters, acrylic acid (C_1-C_{22})hydroxyalkyl esters, methacrylic acid (C_1-C_{22})alkyl

esters, methacrylic acid (C_1 - C_{22})hydroxyalkyl esters, acrylic acid (C_1 - C_{22})alkyl esters or methacrylic acid (C_1 - C_{22})alkyl esters which are substituted by amino, (C_1 - C_{22})alkylamino, (C_1 - C_{22})dialkylamino, $-SO_3H$, epoxy, fluoro, perfluoro or siloxane groups, styrene, substituted styrene, acrylamide and methacrylamide, N-mono(C_1 - C_{22})alkyl acrylamide, N,N-di(C_1 - C_{22})alkyl acrylamide, and a multifunctional monomer with two or more ethylenically unsaturated bonds;

provided that the amount of unsubstituted acrylic acid (C_1 - C_{22})alkyl esters or/and methacrylic acid (C_1 - C_{22})alkyl esters is more than 30 % by weight based on the weight of the total monomer mixture;

E is a group bearing at least one stable free nitroxyl radical, which is bound via the oxygen atom to the polymer or copolymer; or a group which results from a substitution or elimination reaction of the attached stable free nitroxyl radical;

x is the total number of monomer units, which is a number between 5 and 5000;

y is a number 1 or greater than 1 indicating the average number of end groups E attached to the monomer sequence (M)_x;

n is a number from 1 to 20; and

c) optionally water or/and one or more organic solvents.

2. (previously presented) A coating composition according to claim 1, comprising

a2) a thermally cross linking film forming binder resin or resins; or

a3) a radiation curable film forming binder resin or resins.

3. (previously presented) A coating composition according to claim 1₁, comprising

a2) a thermally cross linking film forming binder resin or resins.

4. (previously presented) A coating composition according to claim 1₁, comprising

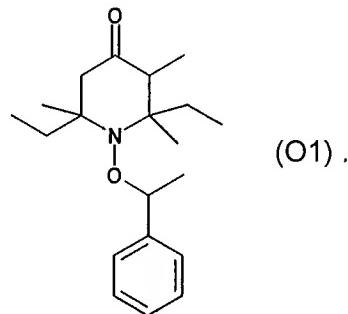

a2) a thermally cross linking film forming binder resin or resins without water and organic solvent, which is in the form of a solid powder.

5. (canceled)

6. (canceled)

7. (currently amended) A coating composition according to claim [[5]]1, wherein the leveling agent of formula (I) is obtained by

b1) polymerization in the presence of an alkoxyamine initiator/regulator of formula (O1)

8. (previously presented) A coating composition according to claim 1, wherein the levelling agent, component b), has a polydispersity of between 1.0 and 2.0.

9. (previously presented) A coating composition according to claim 1, wherein the levelling agent, component b), has a glass transition temperature between 20° C and 200° C.

10. (previously presented) A coating composition according to claim 1, wherein the levelling agent, component b), is composed of at least 30 % by weight of tert-butylacrylate and/or tert-butylmethacrylate, based on the weight of total monomers.

11. (previously presented) A coating composition according to claim 1, wherein the levelling agent, component b), is a linear polymer or copolymer, where in formula (I) n is 1.

12. (previously presented) A coating composition according to claim 1, wherein in formula (I), component b), y is 1.

13. (previously presented) A coating composition according to claim 1, wherein the levelling agent, component b), has a number average molecular weight of between 3000 to 50000 g/mol (Dalton).

14. (previously presented) A coating composition according to claim 1, wherein the levelling agent, component b), is composed of at least 30 % by weight of tert-butylacrylate and/or tert-butylmethacrylate, and 0.5 to 50 % of a functional monomer which is selected from the group consisting of acrylic acid, methacrylic acid, acrylic acid (C₁-C₆)hydroxyalkyl esters, methacrylic acid (C₁-C₆)hydroxyalkyl esters, acrylic acid (C₁-C₆)alkyl esters and methacrylic acid (C₁-C₆)alkyl esters which are substituted by amino, (C₁-C₆)alkylamino, (C₁-C₆)dialkylamino, epoxy, fluoro, perfluoro or siloxane groups.

15. (previously presented) A coating composition according to claim 1, wherein the levelling agent, component b), is composed of at least 50 % by weight of tert-butylacrylate and/or tert-butylmethacrylate and is a solid at room temperature.

16. (previously presented) A coating composition according to claim 1, wherein the levelling agent, component b), is present in an amount of 0.1 to 15% by weight, based on the weight of the film forming binder resin or resins, component a).

17. (previously presented) A process for improving the levelling of a coating composition according to claim 1, which process comprises the steps of applying the coating composition to a substrate and exposing it to thermal energy or electromagnetic radiation in order to obtain a homogenous solid coating.

18-20. (canceled)
